

Inbox AI

Brand-trained, bilingual community management - replies, voice, and proof for clients Prepared by Octo Fusion

THE OPPORTUNITY

Agencies live in the inbox, yet replying to every comment and DM is slow, inconsistent across teammates, and invisible to the client who is paying for it. Hootsuite offers saved replies, but nothing brand-trained and nothing in Arabic. Inbox AI turns community management into a trained, bilingual, on-brand system - and proves the work with a white-labeled report.

FOUR CONNECTED PIECES

1 Brand Voice

Set once per client. Personality, sign-off, key facts, dos and donts - built from references you show it: the connected account, pasted examples, links.

2 Reply Assistant

In the inbox, drafts on-brand replies in the customer's language. Tone chips, Use-to-edit, learns from your edits.

3 Engagement Log

Quietly records every message, reply, response time, and whether AI helped - the data behind the report.

4 Engagement Report

White-labeled, exportable to PDF, WhatsApp or email. Comments, DMs, replies, response rate, sentiment, top questions.

WHY IT BEATS HOOTSUITE

- + Native Arabic + English with RTL - replies, voice and reports in both, which Hootsuite structurally cannot do.
- + Brand-trained per account - consistent across teammates and over time, not generic saved replies.
- + Proof for the client - a white-labeled engagement report showing exactly how much community work you handled.

BUILD ORDER AND STATUS

Bottom-up: (1) Brand Voice + References, then (2) Reply Assistant, then (3) Engagement logging, then (4) Engagement report. All AI routes through the existing endpoint, so no new infrastructure. One dependency: the report needs logging in place to show accurate history, so logging starts recording from day one and the numbers fill in month over month.
